

Fundamental of programming 1

Dr. Marian Wagdy

Lecture 4

Problem Solving with C++

TENTH EDITION

Walter Savitch

Pearson

Chapter 2

2.1 Variables and Assignments

2.2 Input and Output

2.3 Data Types and Expressions

2.4 Simple Flow of Control

2.5 Program Style

2.4

Simple Flow of Control

Simple Flow of Control

- **Flow of control**
 - The order in which statements are executed
- **Branch**
 - Lets program choose between two alternatives

Branch Example

- To calculate hourly wages there are two choices
 - Regular time (up to 40 hours)
 - $\text{grossPay} = \text{rate} * \text{hours};$
 - Overtime (over 40 hours)
 - $\text{grossPay} = \text{rate} * 40 + 1.5 * \text{rate} * (\text{hours} - 40);$
 - The program must choose which of these expressions to use

Designing the Branch

- Decide if ($\text{hours} > 40$) is true
 - If it is true, then use
$$\text{grossPay} = \text{rate} * 40 + 1.5 * \text{rate} * (\text{hours} - 40);$$
 - If it is not true, then use
$$\text{grossPay} = \text{rate} * \text{hours};$$

Implementing the Branch

- if-else statement is used in C++ to perform a branch

```
if (hours > 40)
    grossPay = rate * 40 + 1.5 * rate * (hours - 40);
else
    grossPay = rate * hours;
```

Display 2.8

Display 2.9

Boolean Expressions

- Boolean expressions are expressions that are either true or false
- comparison operators such as '>' (greater than) are used to compare variables and/or numbers
 - (hours > 40) Including the parentheses, is the boolean expression from the wages example
 - A few of the comparison operators that use two symbols (No spaces allowed between the symbols!)
 - \geq greater than or equal to
 - \neq not equal or inequality
 - \equiv equal or equivalent

Display 2.10

if-else Flow Control (1)

- if (boolean expression)
 - true statement
 - else
 - false statement
- When the boolean expression is true
 - Only the true statement is executed
- When the boolean expression is false
 - Only the false statement is executed

if-else Flow Control (2)

- ```
if (boolean expression)
{
 true statements
}
else
{
 false statements
}
```
- When the boolean expression is true
  - Only the true statements enclosed in { } are executed
- When the boolean expression is false
  - Only the false statements enclosed in { } are executed

# AND

- Boolean expressions can be combined into more complex expressions with
  - `&&` -- The AND operator
    - True if both expressions are true
- Syntax: `(Comparison_1) && (Comparison_2)`
- Example: `if ( (2 < x) && (x < 7) )`
  - True only if `x` is between 2 and 7
  - Inside parentheses are optional but enhance meaning

# OR

- `||` -- The OR operator (no space!)
  - True if either or both expressions are true
- Syntax: `(Comparison_1) || (Comparison_2)`
- Example: `if ( ( x == 1) || ( x == y) )`
  - True if x contains 1
  - True if x contains the same value as y
  - True if both comparisons are true

# NOT

- $!$  -- negates any boolean expression
  - $!(x < y)$ 
    - True if  $x$  is NOT less than  $y$
  - $!(x == y)$ 
    - True if  $x$  is NOT equal to  $y$
- $!$  Operator can make expressions difficult to understand...use only when appropriate

# Inequalities

- Be careful translating inequalities to C++
- if  $x < y < z$  translates as

if ( (  $x < y$  )  $\&\&$  (  $y < z$  ) )

NOT

if (  $x < y < z$  )

# Pitfall: Using = or ==

- '=' is the assignment operator
  - Used to assign values to variables
  - Example:    `x = 3;`
- '==' is the equality operator
  - Used to compare values
  - Example:    `if ( x == 3)`
- The compiler will accept this error:  
`if (x = 3)`  
but stores 3 in x instead of comparing x and 3
  - Since the result is 3 (non-zero), the expression is true

# Compound Statements

- A compound statement is more than one statement enclosed in {}
- Branches of if-else statements often need to execute more than one statement
- Example:

```
if (boolean expression)
{
 true statements
}
else
{
 false statements
}
```

**Display 2.11**

# Branches Conclusion

- Can you
  - Write an if-else statement that outputs the word High if the value of the variable score is greater than 100 and Low if the value of score is at most 100? The variables are of type int.
  - Write an if-else statement that outputs the word Warning provided that either the value of the variable temperature is greater than or equal to 100, or the of the variable pressure is greater than or equal to 200, or both. Otherwise, the if\_else sttement outputs the word OK. The variables are of type int.

# Simple Loops

- When an action must be repeated, a loop is used
- C++ includes several ways to create loops
- We start with the while-loop
- Example:

```
while (countDown > 0)
{
 cout << "Hello ";
 countDown -= 1;
}
```
- Output: Hello Hello Hello  
when countDown starts at 3

**Display 2.12**

# While Loop Operation

- First, the boolean expression is evaluated
  - If false, the program skips to the line following the while loop
  - If true, the body of the loop is executed
    - During execution, some item from the boolean expression is changed
  - After executing the loop body, the boolean expression is checked again repeating the process until the expression becomes false
- A while loop might not execute at all if the boolean expression is false on the first check

# while Loop Syntax

- while (boolean expression is true)  
{  
    statements to repeat  
}
- Semi-colons are used only to end the statements  
within the loop
- while (boolean expression is true)  
    statement to repeat

Display 2.13

# do-while loop

- A variation of the while loop.
- A do-while loop is always executed at least once
  - The body of the loop is first executed
  - The boolean expression is checked after the body has been executed

- Syntax:

```
do
{
 statements to repeat
```

**Display 2.14**

**Display 2.15**

```
}
```

`while (boolean_expression);`

# Increment/Decrement

- Unary operators require only one operand
  - + in front of a number such as +5
  - - in front of a number such as -5
- ++ increment operator
  - Adds 1 to the value of a variable  
 $x++;$   
is equivalent to     $x = x + 1;$
- -- decrement operator
  - Subtracts 1 from the value of a variable  
 $x--;$   
is equivalent to     $x = x - 1;$

# Sample Program

- Bank charge card balance of \$50
- 2% per month interest
- How many months without payments before your balance exceeds \$100
- After 1 month:       $\$50 + 2\% \text{ of } \$50 = \$51$
- After 2 months:       $\$51 + 2\% \text{ of } \$51 = \$52.02$
- After 3 months:       $\$52.02 + 2\% \text{ of } \$52.02 \dots$

Display 2.16

C++ Lec2.cpp X C++ Untitled-1

```
C++ Lec2.cpp > main()
1 #include <iostream>
2 using namespace std;
3
4 int main()
{
 float balance = 0;

 cout << "Balance = ";
 cin >> balance;
 for (int i = 1; i <= 12; i++)
 {
 cout << "After " << i << " Month:\n";
 balance += (balance * 0.02);
 cout << " Balance = " << balance;
 cout << "\n";
 }
 return 0;
}
```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL

```
PS E:\Education\Semester 2\Fundamentals of Programming 1> cd "e
semester 2\Fundamentals of Programming 1" ; if ($?) { g++ Lec2.c
; if ($?) { .\Lec2 }
Balance = 50
After 1 Month:
 Balance = 51
After 2 Month:
 Balance = 52.02
After 3 Month:
 Balance = 53.0604
After 4 Month:
 Balance = 54.1216
After 5 Month:
 Balance = 55.204
After 6 Month:
 Balance = 56.3081
After 7 Month:
 Balance = 57.4343
After 8 Month:
 Balance = 58.583
After 9 Month:
 Balance = 59.7546
After 10 Month:
 Balance = 60.9497
After 11 Month:
 Balance = 62.1687
After 12 Month:
 Balance = 63.4121
PS E:\Education\Semester 2\Fundamentals of Programming 1>
```

# Infinite Loops

- Loops that never stop are infinite loops
- The loop body should contain a line that will eventually cause the boolean expression to become false
- Example: Print the odd numbers less than 12

```
x = 1;
while (x != 12)
{
 cout << x << endl;
 x = x + 2;
}
```

- Better to use this comparison: while ( x < 12)

# Section 2.4 Conclusion

- Can you
  - Show the output of this code if x is of type int?

```
x = 10;
while (x > 0)
{
 cout << x << endl;
 x = x - 3;
}
```
  - Show the output of the previous code using the comparison  $x < 0$  instead of  $x > 0$ ?

# 2.5

## Program Style

# Program Style

- A program written with attention to style
  - is easier to read
  - easier to correct
  - easier to change

# Program Style - Indenting

- Items considered a group should look like a group
  - Skip lines between logical groups of statements
  - Indent statements within statements

```
if (x == 0)
 statement;
```
- Braces {} create groups
  - Indent within braces to make the group clear
  - Braces placed on separate lines are easier to locate

# Program Style - Comments

- `//` is the symbol for a single line comment
  - Comments are explanatory notes for the programmer
  - All text on the line following `//` is ignored by the compiler
  - Example: `//calculate regular wages`  
`grossPay = rate * hours;`
- `/*` and `*/` enclose multiple line comments
  - Example: `/* This is a comment that spans`  
`multiple lines without a`  
`comment symbol on the middle line`  
`*/`

# Program Style - Constants

- Number constants have no mnemonic value
- Number constants used throughout a program are difficult to find and change when needed
- Constants
  - Allow us to name number constants so they have meaning
  - Allow us to change all occurrences simply by changing the value of the constant

# Constants

- const is the keyword to declare a constant
- Example:

```
const int WINDOW_COUNT = 10;
```

declares a constant named WINDOW\_COUNT

- Its value cannot be changed by the program like a variable
- It is common to name constants with all capitals

Display 2.17

# Section 2.5 Conclusion

- Can you
  - Create a named constant of type double?
  - Determine if a program can modify the value of a constant?
  - Describe the benefits of comments?
  - Explain why indenting is important in a program?
  - Explain why blank lines are important in a program?

## DISPLAY 2.8 An if-else Statement

```
1 #include <iostream>
2 using namespace std;
3 int main()
4 {
5 int hours;
6 double grossPay, rate;
7 cout << "Enter the hourly rate of pay: $";
8 cin >> rate;
9 cout << "Enter the number of hours worked,\n"
10 << "rounded to a whole number of hours: ";
11 cin >> hours;
12 if (hours > 40)
13 grossPay = rate * 40 + 1.5 * rate * (hours - 40);
14 else
15 grossPay = rate * hours;
16
17 cout.setf(ios::fixed);
18 cout.setf(ios::showpoint);
19 cout.precision(2);
20 cout << "Hours = " << hours << endl;
21 cout << "Hourly pay rate = $" << rate << endl;
22 cout << "Gross pay = $" << grossPay << endl;
23 return 0;
}
```

### Sample Dialogue 1

```
Enter the hourly rate of pay: $20.00
Enter the number of hours worked,
rounded to a whole number of hours: 30
Hours = 30
Hourly pay rate = $20.00
Gross pay = $600.00
```

### Sample Dialogue 2

```
Enter the hourly rate of pay: $10.00
Enter the number of hours worked,
rounded to a whole number of hours: 41
Hours = 41
Hourly pay rate = $10.00
Gross pay = $415.00
```

# Display 2.8

# Display 2.9

## Syntax for an *if-else* Statement

---

### A Single Statement for Each Alternative:

```
if (Boolean_Expression)
 Yes_Statement
else
 No_Statement
```

### A Sequence of Statements for Each Alternative:

```
if (Boolean_Expression)
{
 Yes_Statement_1
 Yes_Statement_2
 ...
 Yes_Statement_Last
}
else
{
 No_Statement_1
 No_Statement_2
 ...
 No_Statement_Last
}
```

---

# Display 2.10

## Comparison Operators

| Math Symbol | English                  | C++ Notation | C++ Sample    | Math Equivalent   |
|-------------|--------------------------|--------------|---------------|-------------------|
| =           | equal to                 | ==           | x + 7 == 2*y  | $x + 7 = 2y$      |
| ≠           | not equal to             | !=           | ans != 'n'    | $ans \neq 'n'$    |
| <           | less than                | <            | count < m + 3 | $count < m + 3$   |
| ≤           | less than or equal to    | <=           | time <= limit | $time \leq limit$ |
| >           | greater than             | >            | time > limit  | $time > limit$    |
| ≥           | greater than or equal to | >=           | age >= 21     | $age \geq 21$     |

# Display 2.11

## Compound Statements Used with *if-else*

---

```
if (my_score > your_score)
{
 cout << "I win!\n";
 wager = wager + 100;
}
else
{
 cout << "I wish these were golf scores.\n";
 wager = 0;
}
```

---

```

Do **not forget** to increase the variable used in the condition, otherwise the loop will never end!

# Nested Loops

The screenshot shows a code editor interface with a dark theme. On the left, the code file `practice.cpp` is open, displaying the following C++ code:

```
C++ practice.cpp > ...
1 #include <iostream>
2 using namespace std;
3
4 int main()
5 {
6 int number = 0;
7
8 for (int i = 1; i <= 2; ++i)
9 {
10 cout << "Outer: " << i << "\n";
11 for (int j = 1; j <= 3; ++j)
12 {
13 cout << "Inner: " << j << "\n";
14 }
15 }
16
17 return 0;
18 }
```

The code consists of two nested loops. The outer loop iterates over `i` from 1 to 2. For each iteration of the outer loop, the inner loop iterates over `j` from 1 to 3. Both loops print their respective values followed by a newline character.

On the right, the terminal window shows the execution of the program and its output:

```
PS E:\Education\Semester 2\Fundamentals of Programming 1> cd "e:\Education\Semester 2\Fundamentals of Programming 1"
PS E:\Education\Semester 2\Fundamentals of Programming 1> g++ practice.cpp -o practice
PS E:\Education\Semester 2\Fundamentals of Programming 1> ./practice
Outer: 1
Inner: 1
Inner: 2
Inner: 3
Outer: 2
Inner: 1
Inner: 2
Inner: 3
```

The terminal output shows the execution of the command to change directory, compile the program, and run it. The program's output is then displayed, showing the nested loop iterations.

# for-each loop in an array

The screenshot shows a code editor interface with a dark theme. On the left, the code file `practice.cpp` is open, displaying the following C++ code:

```
C++ practice.cpp X Untitled-1
C++ practice.cpp > main()
1 #include <iostream>
2 using namespace std;
3
4 int main()
5 {
6 // for-each loop in an array
7 int myNumbers[5] = {10, 20, 30, 40, 50};
8 for (int i : myNumbers)
9 {
10 cout << i << "\n";
11 }
12
13 return 0;
14 }
```

The code defines an array `myNumbers` with five elements and uses a `for`-`each` loop to print each element on a new line. The code editor has tabs for PROBLEMS, OUTPUT, TERMINAL, and other development tools.

The terminal window on the right shows the command-line interface with the following output:

```
PS E:\Education\Semester 2\Fundamentals of Programming 1> cd "e
:\Education\Semester 2\Fundamentals of Programming 1\" ; if ($?
) { g++ practice.cpp -o practice } ; if ($?) { .\practice }
10
20
30
40
50
PS E:\Education\Semester 2\Fundamentals of Programming 1> []
```

The terminal output shows the numbers 10, 20, 30, 40, and 50, each on a new line, indicating that the program was successfully compiled and executed.

break

The screenshot shows a code editor with two tabs: "practice.cpp" and "Untitled-1". The "practice.cpp" tab contains the following C++ code:

```
1 #include <iostream>
2 using namespace std;
3
4 int main()
5 {
6 for (int i = 0; i < 10; i++)
7 {
8 if (i == 4)
9 {
10 break;
11 }
12 cout << i << "\n";
13 }
14
15 return 0;
16 }
```

The terminal window at the bottom shows the command line interface with the following history:

```
PS E:\Education\Semester 2\Fundamentals of Programming 1> cd "e
:Education\Semester 2\Fundamentals of Programming 1"
PS E:\Education\Semester 2\Fundamentals of Programming 1> g++ practice.cpp -o practice
PS E:\Education\Semester 2\Fundamentals of Programming 1> ./practice
```

The break statement can also be used to jump out of a loop.

## The continue

The screenshot shows a code editor with two tabs: "practice.cpp" and "Untitled-1". The "practice.cpp" tab contains the following C++ code:

```
1 // practice.cpp > main()
2 using namespace std;
3
4 int main()
5 {
6 for (int i = 0; i < 10; i++)
7 {
8 if (i == 4)
9 {
10 continue;
11 }
12 cout << i << "\n";
13 }
14
15 return 0;
16 }
17
```

The terminal window on the right shows the execution of the program:

```
PS E:\Education\Semester 2\Fundamentals of Programming 1> cd "E:\Education\Semester 2\Fundamentals of Programming 1"
PS E:\Education\Semester 2\Fundamentals of Programming 1> g++ practice.cpp -o practice
PS E:\Education\Semester 2\Fundamentals of Programming 1> ./practice
0
1
2
3
5
6
7
8
9
```

The continue statement breaks one iteration (in the loop)

```
#include <iostream>
using namespace std;

int main() {
 int i = 0;
 while (i < 10) {
 cout << i << "\n";
 i++;
 if (i == 4) {
 break;
 }
 }
 return 0;
}

The screenshot shows the Visual Studio Code interface with the following details:

- File Bar:** File, Edit, Selection, View, Go, Run, ...
- Title Bar:** Test01.cpp - Visual Studio Code
- Left Sidebar:** Includes icons for File, Find, Replace, Go To, Open, and Settings.
- Code Editor:** Displays the following C++ code:

```
C: > Users > Admin > C++ Test01.cpp > main()
1 #include <iostream>
2 #include <string>
3 using namespace std;
4
5 int main()
6 {
7 int index1[5] = {1, 2, 3, 4, 5}, max = 0;
8 for (int i = 0; i < 5; i++)
9 {
10 if (index1[i] > max)
11 {
12 max = index1[i];
13 }
14 }
15 cout << max;
16 return 0;
17 }
```
- Terminal:** Shows two lines of command-line output:

```
PS C:\Users\Admin> cd "c:\Users\Admin"
\" ; if ($?) { g++ Test01.cpp -o Test
01 } ; if ($?) { .\Test01 }
5
PS C:\Users\Admin>
```
- Bottom Status Bar:** Includes icons for file status (Blackbox), line and column numbers (Ln 15, Col 17), spaces (Spaces: 4), encoding (UTF-8), CRLF, Go Live, Spell, Win32, Prettier, and a checkmark for Formatting.
